Medical Disease Risk Report

Generated: 2026-04-28 22:38:57

Patient Profile

- Glucose: 0.7202797202797202
- SkinThickness: 0.5178571428571429
- Insulin: 0.5271739130434783
- BMI: 0.28705148205928227
- Age: 0.4175824175824177
- Glucose Insulin Ratio: 1.366277882269744
- Age BMI Interaction: 0.1198676518489311
- BP BMI Interaction: 0.10764430577223082

Risk Summary

Predicted Class: 1

Risk Probability: 86.49% (High)

Top Contributing Risk Factors

- Glucose: increases risk (SHAP=2.4237)
- BMI: reduces risk (SHAP=-0.9096)
- Glucose Insulin Ratio: increases risk (SHAP=0.2018)

Recommended Next Steps

- Consult physician as soon as possible for full assessment.
- Begin supervised nutrition and activity intervention plan.
- Monitor key vitals frequently and review medications.

Cost-Benefit Insight

Early intervention saves approx $1,730 in avoidable long-term care costs.
